SPATIAL INTERFACE PROTOTYPE · LEARN WITH SNAP SPECS

REDACT-AR

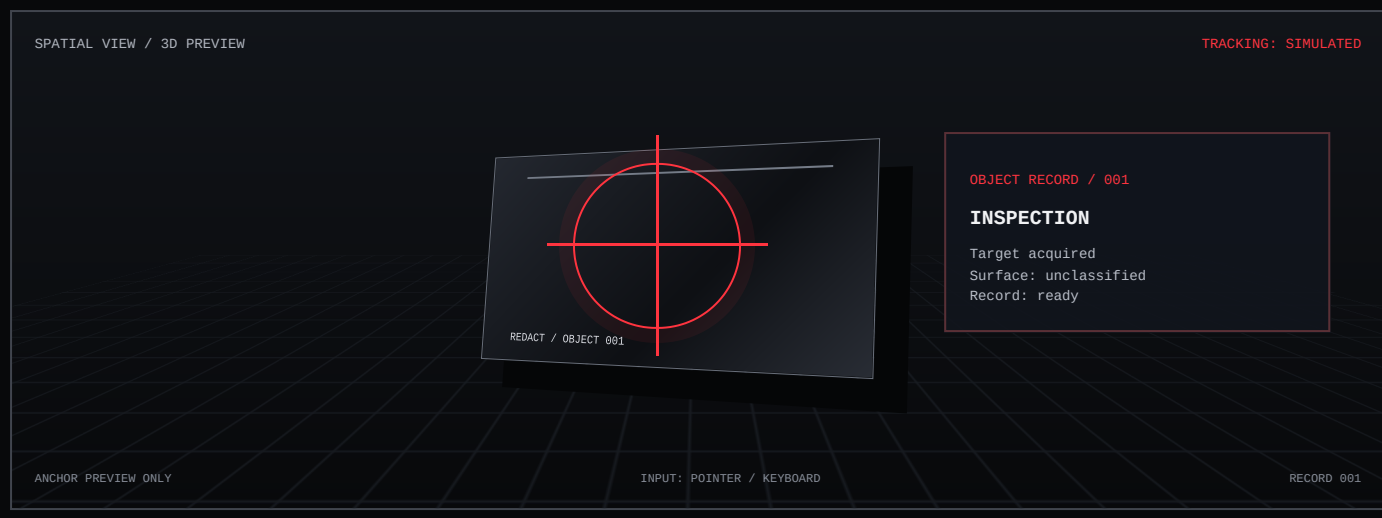

INSPECT OBJECTS. RECORD CONTEXT. KEEP THE INTERFACE SPATIAL.

01 / OVERVIEW

REDACT-AR is a spatial user-interface concept for object inspection. It explores how a compact, high-contrast augmented-reality interface could position inspection metadata beside a selected object while keeping system status and controls easy to scan. The prototype is a self-contained HTML/CSS 3D preview for interaction and presentation.

PROJECT TYPE	AR UX PROTOTYPE
INTERFACE	SPATIAL / 3D
VISUAL SYSTEM	BLACK / RED / GREY
DELIVERY	SINGLE HTML FILE
STATUS	CONCEPT PREVIEW

02 / SPATIAL VIEW — INTERFACE STUDY

03 / INTERACTION MODEL

- **Spatial target:** a reticle identifies the selected demo object.
- **Inspection panel:** presents a concise object record in a separate visual plane.
- **View control:** pointer and keyboard inputs explore the preview.
- **Session actions:** inspect, switch demo records, record an event, or reset.

04 / PROTOTYPE SCOPE

- Single HTML file with CSS-rendered scene and interface.
- No external libraries or backend required for the preview.
- Demonstrates layout, visual hierarchy and interaction intent.
- Next step: port the interface into Lens Studio and validate against supported Specs APIs.

IMPLEMENTATION NOTE / IMPORTANT LIMITATION

This is a desktop-browser simulation, not a functioning headset lens. The scene, target, object anchoring and tracking status are illustrative. This file does not access live camera passthrough, gaze, hand tracking, spatial mapping or object recognition. Those capabilities require supported device APIs and implementation in the target development environment.
